Announcing a successful Ceramic Network grant proposal

A new DAO coordination primitive

We are excited to share our successful grant application through the Ceramic Network Grants Program to build a DAO coordination primitive that makes use of Autonolas-based agent services and dynamic data streams on Ceramic.

The MVP will provide and demonstrate a way to track community contributions in a DAO using data streams. This project will highlight both Autonolas' open, modular structure and Ceramic's potential as a central player in the promising area of Impact Evaluators.

The grant will be used to deliver a toolkit for building simple IEs and a live implementation of the toolkit as a decentralized off-chain service powered by Autonolas.

To learn more about the grant proposal, please visit the [grant proposal](#).

We'd like to extend our gratitude to the Grants Team at Ceramic and look forward to exploring this exciting new use case for our respective technologies together.
